StorePulse — Getting Started Guide

This guide walks a new StorePulse customer through the first weeks of using the platform, from account setup to running the first end of day reconciliation.

1. Overview

StorePulse is a retail and inventory management platform built for single shops and small multi-branch chains. It combines point of sale integration, stock tracking and sales analytics in one dashboard.

2. Setting Up Your First Store

Create a store profile with its address, opening hours and time zone. Each additional branch on the Pro and Enterprise plans gets its own store profile, and stock levels are tracked separately per branch while still rolling up into one company-wide report.

3. Importing Your Product Catalog

Product catalogs can be imported from a CSV export of your previous point of sale system. StorePulse maps product name, SKU, barcode, category, cost price and retail price automatically where the column names are recognized, and lets you correct any mapping by hand before the import runs.

4. Onboarding Walkthrough

When a new store signs up for StorePulse the onboarding specialist begins by scheduling a short call to understand how many locations the business operates and whether products are tracked by barcode, by SKU or by both, and then moves on to importing the existing product catalog from whatever spreadsheet or point of sale export the store was using before, which usually means mapping columns for product name, SKU, barcode, category, cost price and retail price into the fields StorePulse expects, after which the specialist configures the low stock thresholds for each category together with the supplier contact who should be notified automatically when a reorder is needed, and only once that structure is in place does the team move on to connecting the till hardware and testing a handful of sample transactions to confirm that stock levels update correctly across every connected branch in real time, before finally scheduling a short live training session with the staff who will be running the till every day, walking them through sales, returns, stock transfers between branches and the end of day reconciliation report so that on the store's actual go-live morning nobody behind the counter is seeing the software for the first time while a real customer is standing at the till waiting to pay.

5. Low Stock Alerts

Each product category has a configurable low stock threshold. When a SKU drops below its threshold, StorePulse notifies the assigned supplier contact automatically and flags the item on the dashboard until it is restocked.

6. End of Day Reconciliation

At the close of business, the till staff run the end of day report, which compares recorded sales against the cash and card totals and flags any discrepancy for a manager to review before the drawer is closed out.

7. Getting Help

Support contact details and hours depend on your plan. See the Availability and Support Hours document, or contact support@nyronsoftware.com.
